PROJECT COURAGE

A powerful initiative specifically designed to bring joy to children going in for procedures in the hospital.

It's been well documented that stress and anxiety can detract from the healing process. The Honda Shogo is a small vehicle designed to reduce anxiety. In collaboration with health professionals, Honda engineers developed the vehicle with special features that were specifically built around the specialized needs of young patients.

Instead of using a wheelchair, kids can drive themselves to their treatment or procedure in a small electric Honda. Because many children in the hospital range in age, size and various stages of treatment, inclusion was a key factor in the design. It's one small way Honda is brightening the lives of children on their road to recovery.

"You can really see the impact that the Honda Shogo has made in a patient when you speak to them after a ride."

They have more energy and excitement. It is a great tool to help engage patients and get them back to full health."
